

**Abstract**

A system and method for producing a flip-over storytelling book having a first set of pages in diametric contraposition to a second set of pages includes a software program for generating the first and second sets of pages from user input. A kit for producing such books includes a software program and a blank book (composed of a front cover, a back cover, a binding, blank leaves, and/or pocket-leaves) for insertion of the pages generated by using the software program. The generated pages may include indicia indicating the sequence and orientation of the first and second sets of pages.
